VCL Delphi Component for Labels

January 3, 2012

The component extends the standard component "TLabel". The component is intended for creating of labels by API. It can, for example, create vertical text and shadow of text.

The Component is a successor of TGraphicControl. It has a following properties from the ancestor:

1. property Left;

2. property Top;

3. property Height;

4. property Width;

It has a new properties such as:

1. property FontName; // name of font

2. property TextXPos; // x-position of text in component

3. property TextYPos; // y-position of text in component

4. property Transp; // background's transparent (true, false)

5. property Color; // background color

6. property Text; // user's text

7. property FontColor; // font color

8. property FontHeight; // font height

9. property FontWidth; // font width

10. property FontWeight; // font weight (heavy etc.)

11. property Underline; // underline (true, false)

12. property Escapement; // angle of text to horizontal direction in 0,1 deg.

13. property Italic; // italic font (true, false)

14. property StrikeOut; // strike out (true, false)

15. property ShadowX; // distance from shadow to text by x

16. property ShadowY; // distance from shadow to text by y

17. property ShadowColor; // shadow color

The demonstration example is in a folder "Example". Install the component and run project in this folder. In a folder "Example Dyn. Use" - another one. It can be tried without installation of component.
